Motivation

1. Image retrieval techniques are needed in different applications.

Normal search

Online shopping

Biological and medical research

Social Network

Motivation

2. Sensitive Images

Magnetic resonance images

Famous people

Challenges

- 1. Variation of images:

Viewpoint variation

Scale variation

Deformation

Occlusion

Illumination conditions

Background clutter

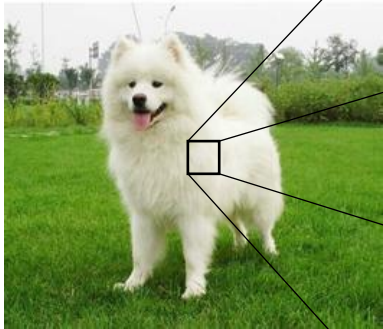

Intra-class variation

(Image source: <http://cs231n.github.io/classification/>)

Challenges

- 2. Semantic gap:

13	97	70	10	17	32	86	58	43	23	86	25	21	85	56
26	46	74	93	80	12	57	07	11	33	87	85	01	42	04
73	19	34	75	02	75	14	68	30	69	05	01	96	14	84

Selected image retrieval schemes

B-Hie: Hierarchical Semantic Indexing for Large Scale Image Retrieval ^[1]

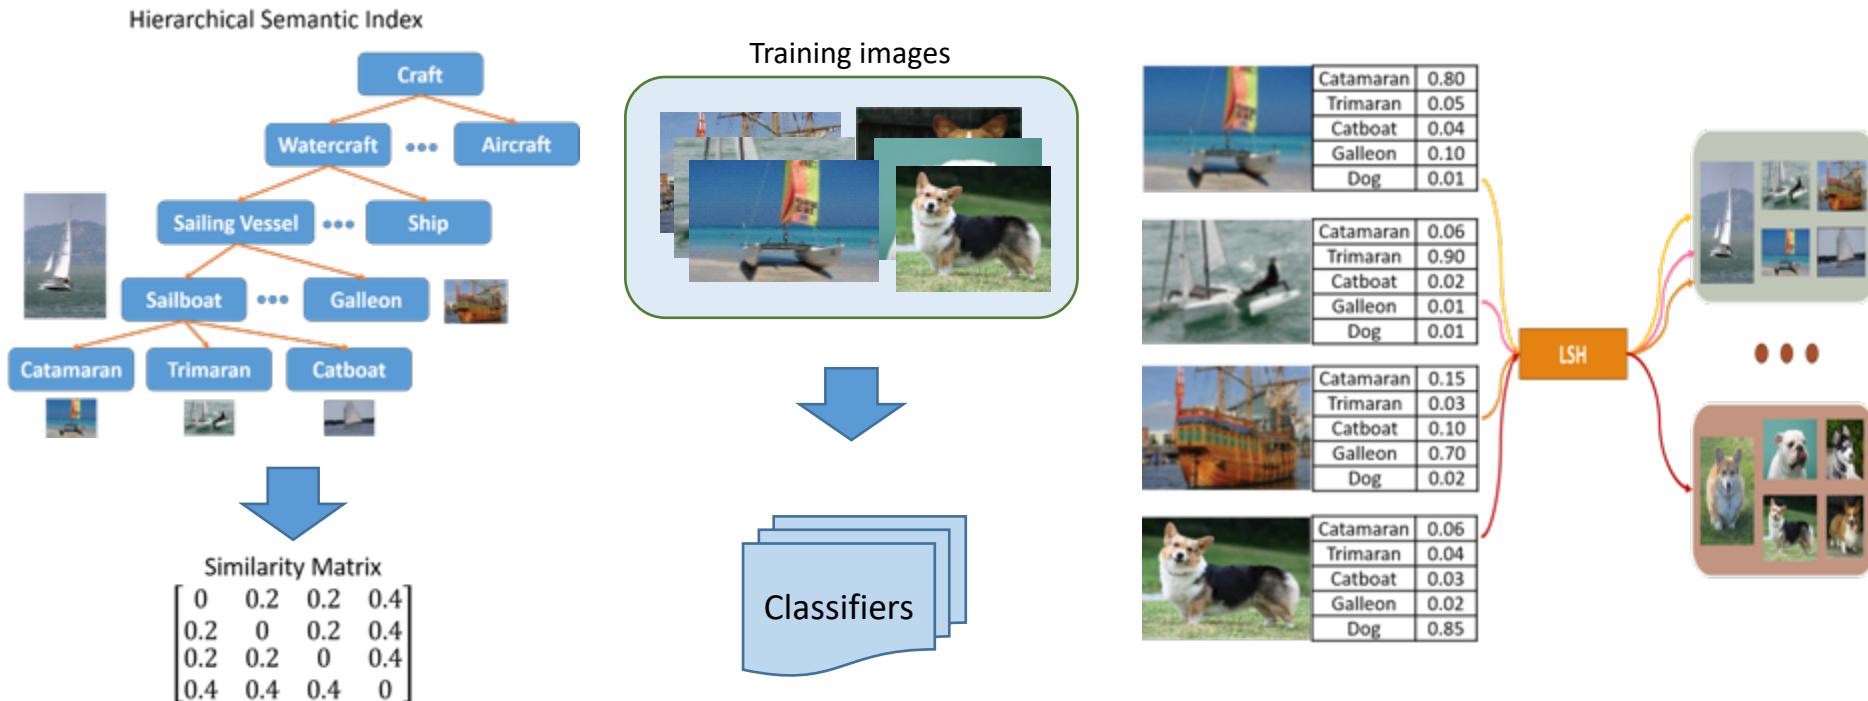

- Jia Deng, Alexander C. Berg, Li Fei-Fei
- CVPR, 2011

- Goal:
 - This paper aims to address the problem of similar image retrieval, especially in the setting of large-scale datasets with millions to billions of images.

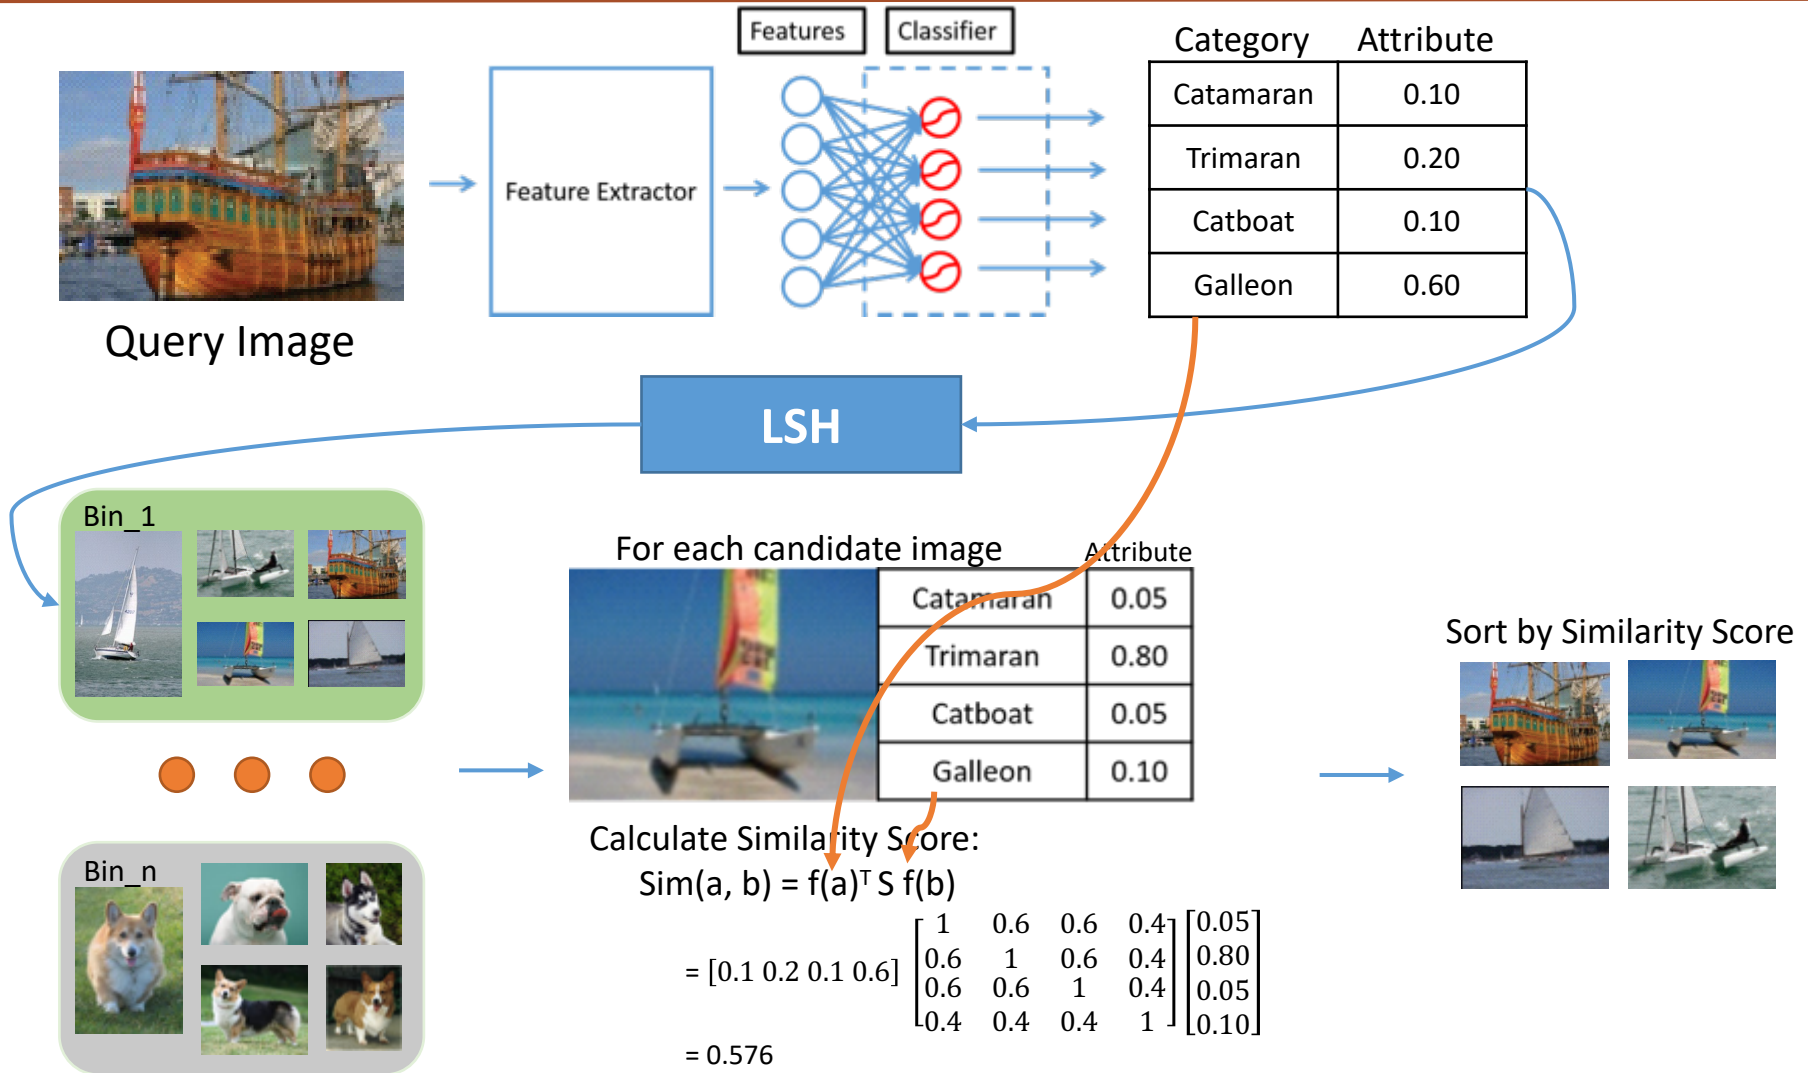

System Flow

Four steps to build the system:

1. Calculate a similarity matrix based on a given hierarchical semantic tree.
2. Train a 1-vs-all classifier for each category.
3. Generate an attribute vector for each training image using trained classifiers.
4. Hash all images into different bins based on attribute vectors.

Query process

Limitation

- 1. The dimension of attribute vector may be very large.
- 2. Use all classifiers for each query image.
 - => Slow query response time.
- 3. Need to re-compute the attribute vectors for all images even if we only add one new category.
- 4. No privacy-aware.

Selected image retrieval schemes

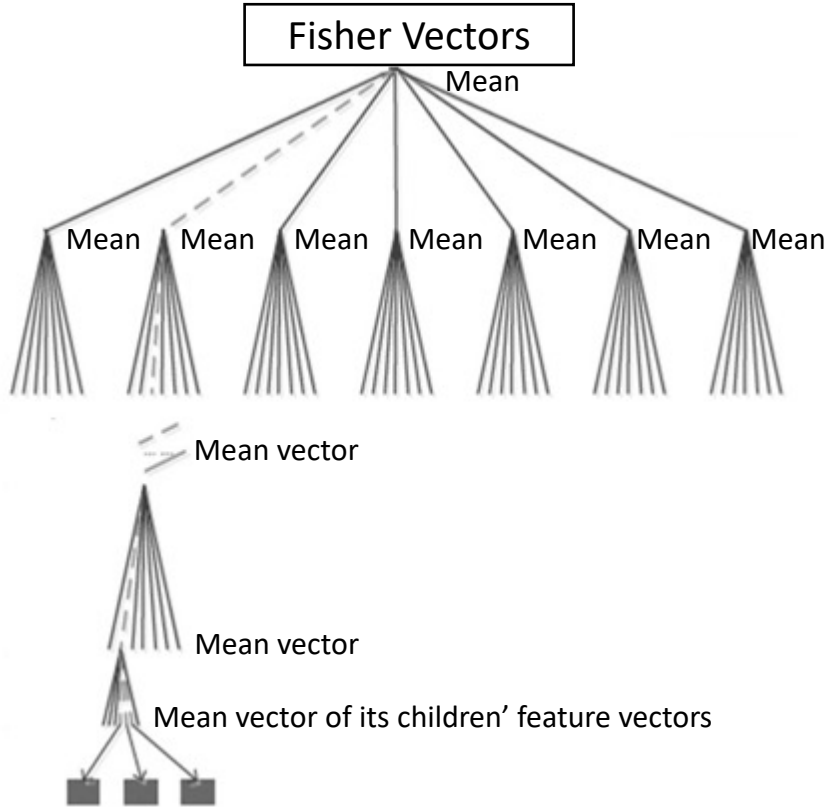

SEISA: Secure and Efficient Encrypted Image Search With Access Control [2]

- Jiawei Yuan, Shucheng Yu, Linke Guo
 - INFOCOM, 2015

- Goal:
 - This paper aims to search encrypted images in a secure and efficient way.

1. Build an index tree

- a. Extract **Fisher vector** from each image.
- b. Employ the **K-Means** to generate the tree.
- c. Assigns a **mean vector** to each intermediate node.

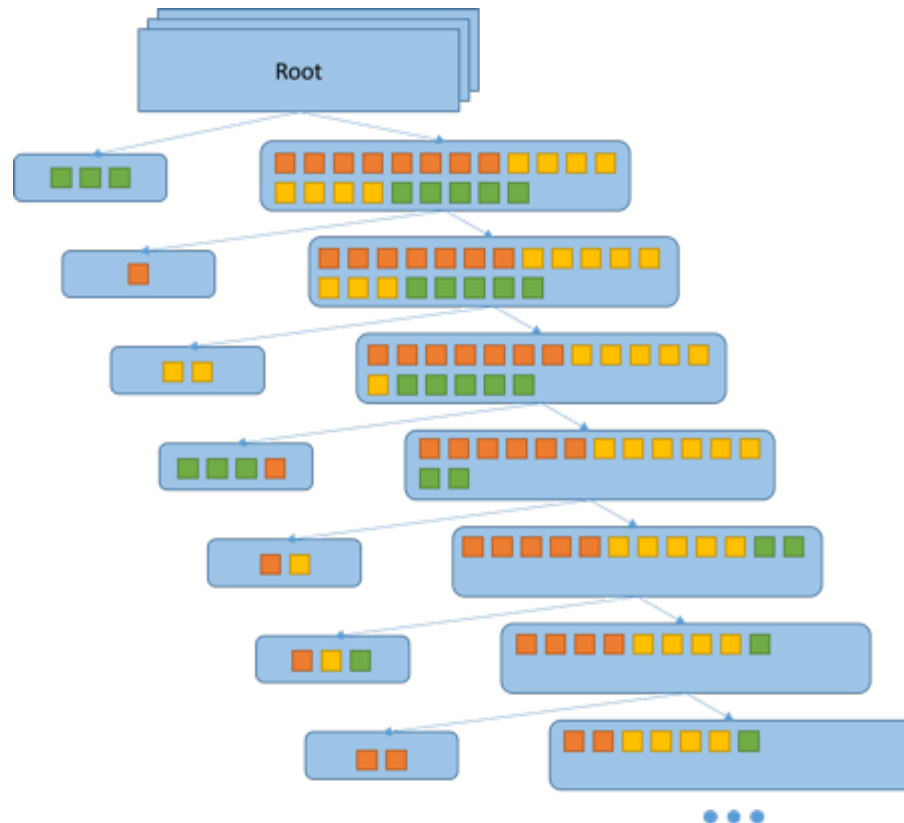

2. Image retrieval

Search the most similar nodes through the index tree.

Limitation

- It is possible that the depth of the index tree can become very deep.
- => Slow query response time and low retrieval accuracy.

OUTLINE

- Motivation and challenges
- Selected image retrieval schemes
- **Our solution**
- Evaluations
- Future work
- References

Our solution

Build an efficient image retrieval system

- **Scalable**

- Deal with large-scale datasets.

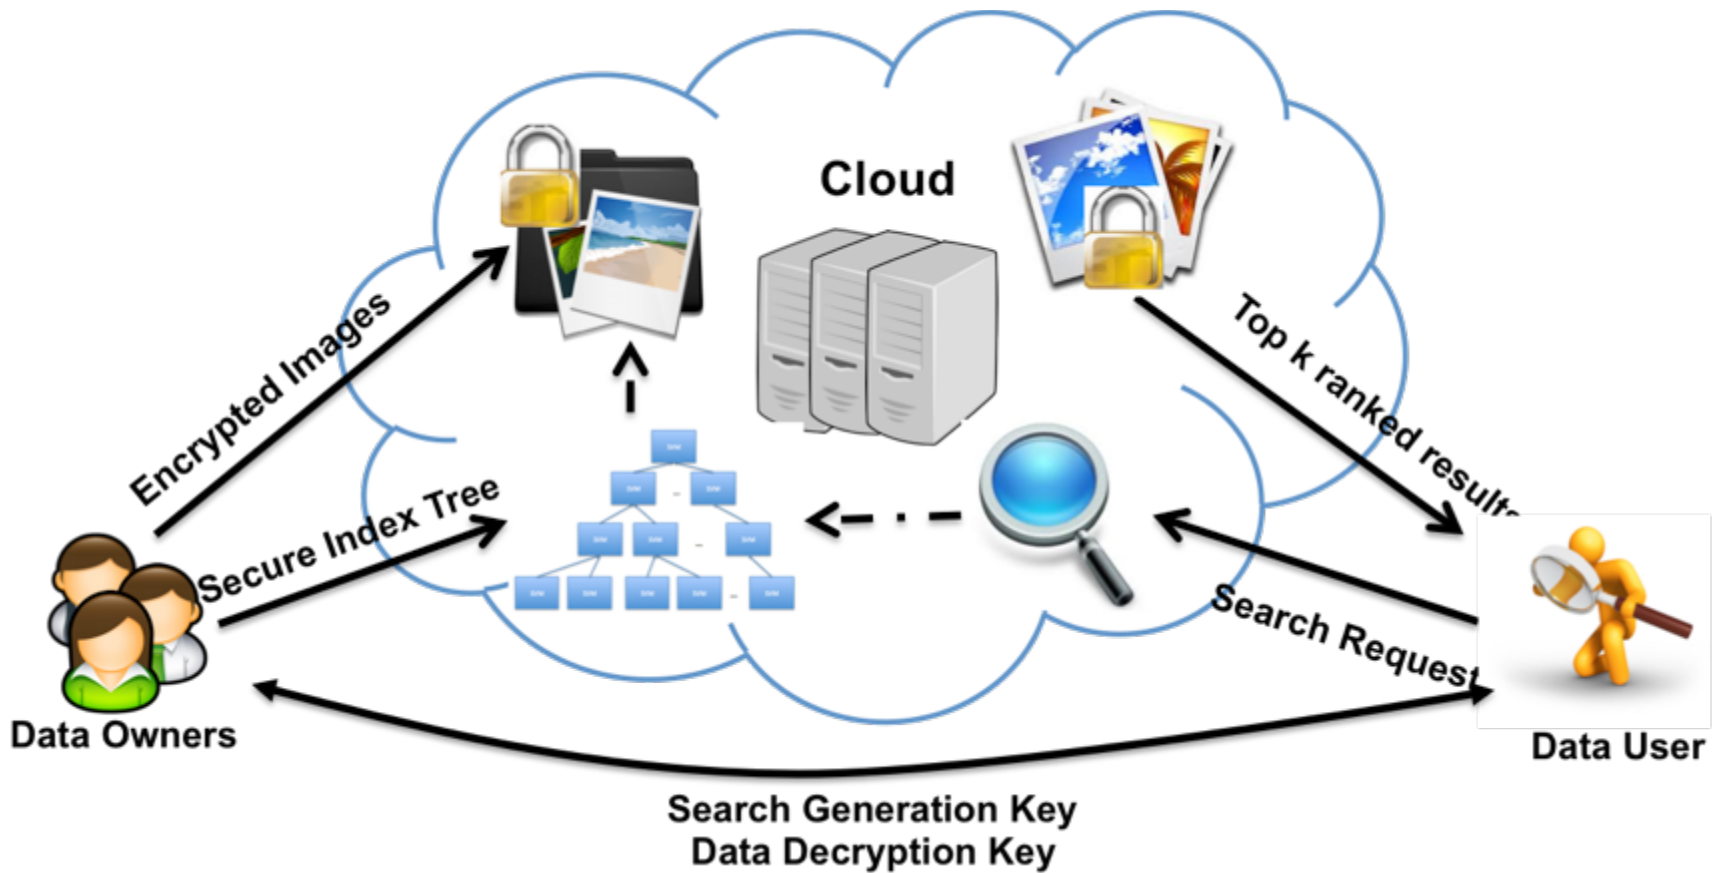

- **Hierarchical**

- Speed up the query process by using hierarchical structure to quickly identify a small subset of candidate images.

- **Secure**

- Prevent the sensitive information of images from being leaked.

System Model

Visual feature representation

Image feature:

Fischer, Philipp, Alexey Dosovitskiy, and Thomas Brox. "Descriptor matching with convolutional neural networks: a comparison to sift." *arXiv preprint arXiv:1405.5769* (2014).

-1	1	b ₂	b ₃	-1	b ₅	-1		

Step 3: Generate invertible random matrices M₁ and M₂

Step 4: $Enc(RV_1') = \{M_1^T RV_{11}', M_2^T RV_{12}'\}$ $Enc(RV_2') = \{M_1^{-1} RV_{21}', M_2^{-1} RV_{22}'\}$

Distance:
$$D(RV_1, RV_2) = \frac{n - RV_1' \cdot RV_2'}{2} = \frac{n - Enc(RV_1') \cdot Enc(RV_2')}{2}$$

Query process (with encryption)

OUTLINE

- Motivation and challenges
- Selected image retrieval schemes
- Our solution
- **Evaluations**
- Future work
- References

Evaluations

- Metrics:

- Precision at top k (P@k)

$$P@k = \frac{\text{num_correct}}{k}$$

- Mean average precision (mAP)

$$AP(q) = \frac{\sum_{k=1}^n (P@k * rel(k))}{N}$$

- Dataset:

- Caltech256

- 30608 images, 256 object categories

- INRIA Holiday

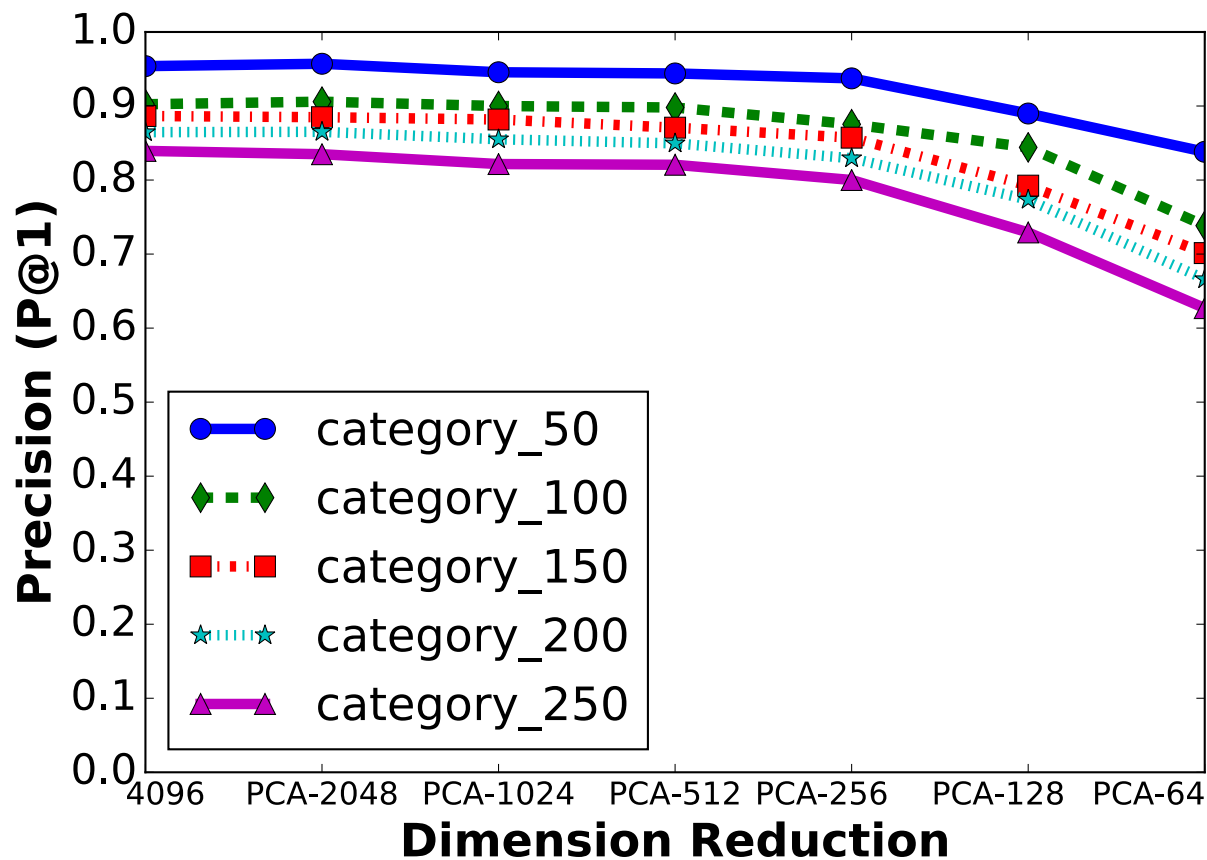

- 1491 images, 500 image groups

- Evaluate on:

- A laptop running OS X
- 2.5GHz Intel Core i7 CPU
- 16GB Memory

Evaluations – Effectiveness of RV

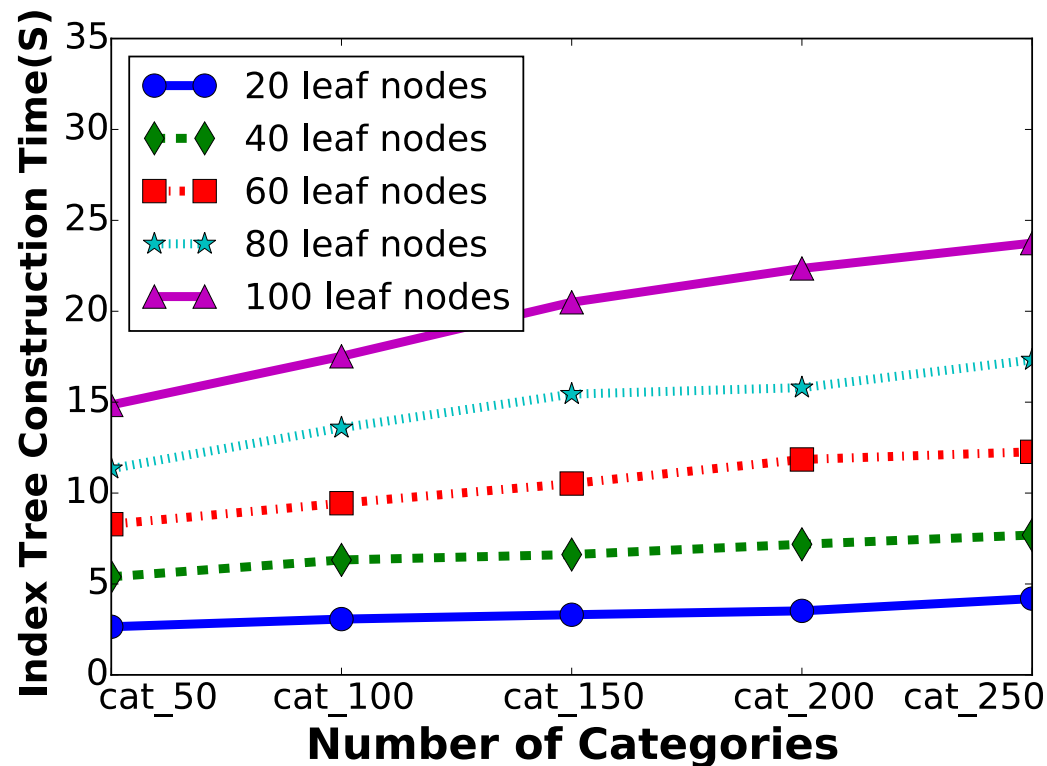

- 50 images per category are used
- Using image category label to build the index tree instead of K-Means.

Evaluations – System Construction

Computation time of building a hierarchical index tree.

- 50 images per category are used
- binary code: PCA-128

Evaluations – Storage Cost

CASHEIRS: (binary code: PCA-128)

- CNN model: 244.7 MB [Data owner | Data user]
- PCA matrix: 3.3 MB [Data owner | Data user]
- Rotation matrix: 105 KB [Data owner | Data user]
- Encrypted key: 1.7 KB [Data owner | Data user]

- Encrypted images: 14.28 KB/image (300 x 200 pixels) [Data owner | Cloud]
- Encrypted index tree: 440 KB (cat_50) [Data owner | Cloud]
- Image features: 5.3 MB (cat_50) [Data owner | Cloud]

Cloud Storage Cost (MB)	Cat_50	Cat_100	Cat_150	Cat_200	Cat_250
CASHEIRS	40.6	81.0	121.5	161.4	201.7
B-Hie	59.8	120.4	181.0	241.7	302.4
OASIS	109.3	197.4	285.5	373.6	461.7
SEISA (PCA-128)	40.3	80.8	122.3	167.1	211.8
SEISA (PCA-512)	55.7	113.9	175.9	239.6	303.3

Evaluations – Search Evaluation

TABLE II: Comparison Results

Caltech256			
Schemes	Search Time (ms)		
	Category-10	Category-20	Category-50
CASHEIRS	4.1	9.6	12.9
B-Hie	13.3	23.2	52.2
OASIS	131.9	132.6	133.9

INRIA Holiday (10 million images)		
Scheme	Search Time (ms)	mAP
CASHEIRS	95.2	0.64
SEISA	87.5	0.55

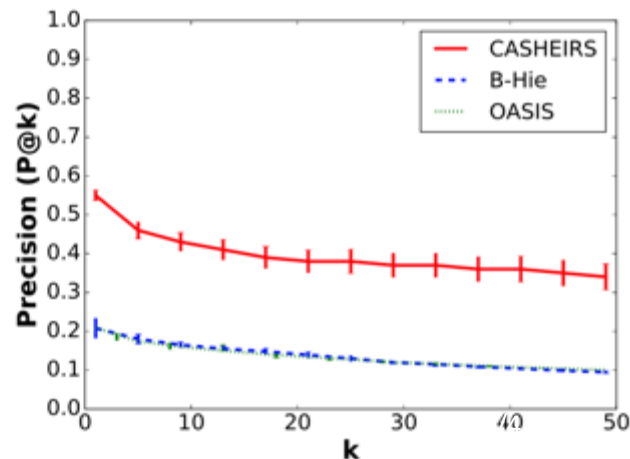

We randomly generate 10 Million image features (128 dimension), and then mix them with the features extracted from INRIA Holiday dataset. (Same set-up as SEISA)

Accuracy on Caltech256 dataset

10 classes

20 classes

50 classes

Evaluations – Search Evaluation

Communication Cost:

Data owner **to the cloud**:

11.2 MB encrypted index tree [one time]

14.28 KB/encrypted image (300 x 200 pixels) [one time]

A user:

[one time]

receive 248.1 MB CNN model and encryption keys **from the Data owner**

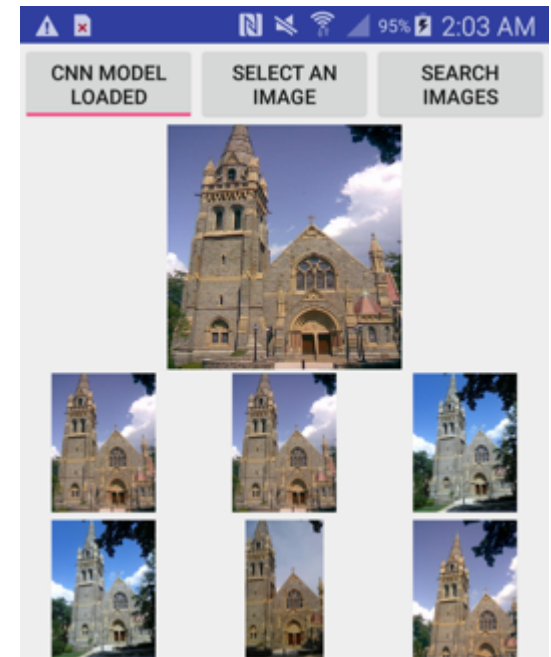

[**Querying**]

send 2 KB encrypted query information **to the cloud**

receive 14.28 KB/encrypted image (300 x 200 pixels) **from the cloud**

Prototype

- Cloud server:
 - A laptop running OS X
 - 2.5GHz Intel Core i7 CPU
 - 16GB Memory
- Client
 - Samsung S5 phone
 - Snapdragon 801 chip with 2.5GHz Quad-core CPU
 - 2GB RAM
- Communication
 - WIFI router

OUTLINE

- Motivation and challenges
- Selected image retrieval schemes
- Our solution
- Evaluations
- **Future work**
- References

Future work

- Using larger image datasets, e.g. ImageNet.
- More efficient security solution.
 - 128 bit binary code into 2 KB encrypted information.
- Using deep learning model to generate a binary code directly.

Conclusion

- Challenges in the field of image retrieval.
- Related papers and their limitations.
- Propose our solution.
